

Task 1 - Web Application QA Report

Ashish Kumar Ishwar | Tested 30 September 2026 | Microsoft Edge on Windows

Application: Wasp RealWorld demo - <https://wasp-rwa.netlify.app>

Assessment summary

Registration and login were attempted and blocked by HTTP 503 responses to their preflight requests. Blank-field and invalid-email submission, label interaction, and registration HTML were inspected. Create, edit, delete and logout could not be exercised because no authenticated session was established. The originally suggested demo.realworld.io returned HTTP 404; this alternative was selected. Findings are based on supplied screenshots and tester observations, not a full source-code audit.

#	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
1	Registration and login blocked by backend availability	Open /register; fill test details; submit. Open /login; submit test credentials. Inspect Network.	Expected: API handles registration/login or returns an actionable validation/authentication response. Actual: OPTIONS to /auth/signup and /auth/login returns 503; no authenticated session.	High	Backend or hosting service unavailable. Exact cause requires server logs; a CORS warning alone is not proof of misconfigured CORS.
2	Authentication failure lacks recovery guidance	Submit registration or login while API is unavailable. Read the displayed feedback.	Expected: explain temporary service failure and suggest retrying. Actual: only "Error: Network Error" or "Network Error" is shown.	Medium	Technical network exception surfaced without user-oriented error mapping.
3	Registration lacks useful client-side validation	Submit all fields blank. Repeat with email abc and other fields populated.	Expected: required-field and email-format messages before submission. Actual: tester observed the same network error. HTML shows email type=text and no visible required attributes. Server validation is unverified.	Medium	Missing or ineffective client validation; native email validation not enabled.
4	Registration inputs lack associated labels	Click Username, Email and Password headings. Inspect surrounding HTML.	Expected: clicking each label focuses its field, with a programmatic label association. Actual: none focuses the field; titles are h2 elements, with no visible label association.	Medium	Headings used instead of associated label elements. Screen-reader behaviour was not directly tested.
5	New-password autocomplete hint absent	Inspect password input on /register. Examine attributes.	Expected: registration password identifies its purpose using autocomplete=new-password. Actual: hint absent; aria-autocomplete=list is visible instead.	Low	Input purpose metadata omitted. Actual password-manager failure has not been demonstrated.

Root-cause analysis - authentication availability

Registration and login fail before the browser can complete the authentication exchange. Network evidence shows OPTIONS requests to the Heroku authentication endpoints returning HTTP 503 Service Unavailable. The earlier Console evidence also shows a CORS preflight failure, which can accompany an unavailable service response lacking the required headers. This supports a backend or hosting availability problem, but does not establish the exact infrastructure fault. The frontend then displays a generic network error, leaving users without useful recovery instructions. I would first inspect hosting health, deployment configuration and server logs, then restore the API service. After recovery, I would verify that preflight responses allow the intended frontend origin and required methods and headers. I would also map service failures to clear retry guidance without exposing internal error details. Finally, I would retest registration and login with valid and invalid inputs, then complete create, edit, delete and logout testing.

Evidence index

Images/signup_preflight_503.png - registration OPTIONS request returns 503.

Images/login_preflight_503.png - login OPTIONS request returns 503.

Images/signup_failure_console.png - CORS/network error and generic UI feedback.

Images/registration_form_html.png - field types, heading labels and password attributes.

Blank-input, invalid-email and label-click outcomes were reported by the tester during guided testing.

Recommended priority

Restore authentication service first; improve failure feedback and client validation next. Associate labels with inputs and add appropriate autocomplete hints. Retest authenticated flows after service recovery. No repository changes or server-side fixes were made during this assessment.
